

The 8 Most Important Ways to Stay Healthy and Prevent Disease

- 1 Don't Smoke.** If you do smoke, talk to your doctor about quitting. You can also help yourself by following tips on websites (www.smokefree.gov) or talking with someone at the National Quitline (1-800-QUITNOW). There are additional resources available at www.healthfinder.gov; search for "smoking" once you've accessed the site. Smoking is a major preventable risk factor that is associated with early death. Common causes are emphysema, lung disease, and heart disease.
- 2 Be Physically Active.** If you are not already physically active, start small and work up to 30 minutes or more of moderate physical activity most days of the week. Walking briskly, mowing the lawn, dancing, swimming, and bicycling are just a few examples of moderate physical activity.
- 3 Eat a Healthy Diet.** Emphasize fruits, vegetables, whole grains, and fat-free or low-fat milk and milk products; include lean meats, poultry, fish, beans, eggs, and nuts; eat foods low in saturated fats, trans fats, cholesterol, salt, and added sugars.
- 4 Stay at a Healthy Weight.** Balance calories from foods and beverages with calories you burn off by your activities. Check with your doctor if you start to gain or lose weight.
- 5 Drink Alcohol Only in Moderation.** If you drink alcohol, have no more than two drinks a day if you are 65 or younger. If you are older than 65, have no more than one drink a day. A standard drink is one 12-ounce bottle of beer or wine cooler, one 5-ounce glass of wine, or 1.5 ounces of 80-proof distilled spirits.

- 6 Get The Screening Tests Recommended for You.**

BODY MASS INDEX (BMI): Have your body mass index calculated to screen for obesity. BMI is a measure of body fat based on height and weight. You can also calculate your own BMI by using the BMI calculator on the website for the National Heart, Lung, and Blood Institute (www.nhlbisupport.com/bmi/).

CHOLESTEROL: Have your cholesterol checked regularly.

BLOOD PRESSURE: Have your blood pressure checked at least every 2 years. High blood pressure is 140/90 or higher. Successful treatment will prevent heart disease and stroke.

COLORECTAL CANCER: Have a test for colorectal cancer starting at age 50. Your doctor can help you decide which test is right for you. If you have a family history of colorectal cancer, you may need to be tested earlier.

DIABETES: Have a test for diabetes if you have high blood pressure. If you are diabetic, tight glucose control is very important. Maintaining HbA1c less than 7.0 will reduce vascular, heart, and kidney disease as well as blindness and nerve damage.

DEPRESSION: Your emotional health is as important as your physical health. If you have felt "down", sad, or hopeless over the last two weeks or have felt little interest or pleasure in doing things, you may be depressed. Talk to your doctor about being screened for depression.

PROSTATE SCREENING: Discuss the risks and benefits of this test with your personal physician.

SEXUALLY TRANSMITTED

INFECTIONS: Talk to your doctor to see whether you should be tested for sexually transmitted infections.

HIV: Talk to your doctor about HIV screening if you:

- Have had sex with men since 1975
- Have had unprotected sex with multiple partners
- Have used or now use injection drugs
- Exchange sex for money or drugs or have sex partners who do
- Have past or present sex partners who are HIV-infected, are bisexual, or use injection drugs
- Are being treated for sexually transmitted diseases
- Had a blood transfusion between 1978 and 1985.

ABDOMINAL AORTIC ANEURYSM:

If you are between the ages of 65 and 75 and have ever smoked (100 or more cigarettes during your lifetime), you need to be screened once for abdominal aortic aneurysm, which is an abnormally large or swollen blood vessel in your abdomen.

- 7 Take Preventive Medications If You Need Them.** Ask your doctor about taking aspirin to prevent heart disease.
- 8 Stay Up-to-Date with Your Immunizations.** You need a flu shot every year. You can prevent other serious diseases, such as pneumonia, whooping cough, and shingles by being vaccinated. Talk with your primary care provider about the vaccines you need and when you should get them.
